

MICROSOFT 365 COPILOT

M365 Usage Dashboard

Interpretation Guide

Template version: September 5, 2026

Companion pipeline: Purview_M365_Usage_Bundle_Explosion_Processor_v2.6.1.py

Audience: Customer Success Managers • Adoption Leads • Tenant Admins • ROI Advisors

Agenda

- **1. What's new** Changes since the May 19 edition
- **2. Five-minute orientation** Reading order for time-pressed reviewers
- **3. Data model** Fact tables, dimensions, helpers
- **4. Page walkthrough** All 10 dashboard pages, in order
- **5. Methodology** Weighting, percentiles, prompts vs events
- **6. Data pipeline** Python v2.6.1 outputs and refresh
- **7. Measure glossary** Org • LP • OPT • CE measures
- **8. Appendix** Export formats and PDF conversion

What's new vs. the May 19 edition

The makeover adds two decision pages while preserving the existing five-input data contract.

- Department Readiness (NEW page) Department-normalized readiness, licensing, utilization, and recommended actions
- Adoption Momentum (NEW page) Current vs. previous 30-day movement for users and departments
- Ten-page navigation Executive Summary and M365 Usage Trends now lead directly into readiness and momentum
- Existing processor contract No new source or sixth file; continue using Python v2.6.1 default outputs
- Required generated outputs UserStats and SessionStats must not be skipped
- Momentum history Use at least 60 days for a complete current-versus-previous comparison

Five-minute orientation

If you only have five minutes, read these four pages in order:

1 STEP	2 STEP	3 STEP	4 STEP
Executive Summary Tenant snapshot — are people using M365 and Copilot?	Department Readiness Compare departments to target licensing, enablement, and champion-led scale.	Adoption Momentum Find users and departments that are accelerating, declining, new, or stalled.	Copilot License Optimizer Operational view: reclaim inactive seats and assign licenses to top candidates.

Data model at a glance

Two fact tables, one user dimension, and a set of disconnected helper tables.

Core tables

- **EntraUsers** User dimension — Microsoft Graph / Entra ID export
- **M365Usage** Audit-event fact — Purview Unified Audit Log, rolled up by the Python pipeline
- **M365CopilotSessions** Session/prompt fact — from SessionStats.csv (v2.6.1+)

Disconnected helpers (slicers)

- LP Weight Profiles [Balanced](#) / [Collab](#) / [Content](#) / [Custom](#)
- Six Weight % tables [Teams](#), [Outlook](#), [Word](#), [Excel](#), [PPT](#), [Copilot Chat](#)
- Inactivity Window [30](#) / [60](#) / [90 days](#)
- Lookback Window [Optimizer ranking window](#)
- LP Action Categories [License First](#) / [Next](#) / [Potential](#) / [Developing](#)
- Champion Tier [Champion](#) / [Active](#) / [Light](#) / [Inactive](#)
- Department Readiness + Momentum Metric [Window and metric selectors for the two new pages](#)

Key relationship: M365Usage[UserId] —M:1—> EntraUsers[userPrincipalName] (bidirectional). All helper tables are disconnected — they reach the model only via SELECTEDVALUE() in DAX measures. New-page requirement: run the v2.6.1 default rollup and retain both UserStats and SessionStats outputs.

Page-by-page walkthrough

M365 Usage Dashboard — Interpretation Guide • September 5, 2026

Key takeaways

- **Purpose** Tenant snapshot: how active is M365, how big is the Copilot footprint.
- **KPI row** M365 Users • Teams • Email • Document • Copilot • Depts.
- **Top Apps bar** Stacked per-app breakdown; tooltip shows exact counts.
- **Read it** Big gap between M365 Users and Copilot Users = strong enablement opportunity.

Key takeaways

- **Cards** Total Users • Active M365 Users for the audit window.
- **Trend line** Daily/weekly volume by app — watch for seasonality and inflections.
- **Date slicer** Narrow the window for incident or campaign analysis.
- **Validate** Sharp drop-off without explanation? Check the data pipeline first.

Filters

Key takeaways

- 1. **Purpose** Compare normalized M365 readiness, Copilot adoption, and licensing by department.
- 2. **Readiness gap** M365 percentile minus Copilot percentile; larger positive gaps indicate enablement opportunity.
- 3. **Utilization** Compare license coverage with the share of licensed users who actively prompt.
- 4. **Data contract** Uses the existing Rollup, UserStats, SessionStats, and Entra inputs—no new source.
- 5. **Required outputs** Run the v2.6.1 default rollup. Do not skip UserStats or SessionStats.

Processor requirement: UserStats supplies percentile ranks; SessionStats supplies prompt activity. Both are part of the existing v2.6.1 output contract.

Key takeaways

- 1. Purpose** Identify new, accelerating, stable, declining, and stalled licensed users.
- 2. Current vs. previous** M365 compares L30 with L60 minus L30; Copilot uses daily SessionStats.
- 3. Thresholds** New/current ≥ 5 ; accelerating or declining at $\pm 20\%$; licensed current < 5 is stalled.
- 4. Data contract** Uses the same five template inputs—no extra file or data source.
- 5. History requirement** Load at least 60 days for meaningful comparison. One week tests compatibility only.

Interpretation guardrail: 60+ days is required for a complete current-versus-previous 30-day view. Shorter windows can overclassify users as New.

Key takeaways

- **Profile slicer** Balanced / Collab / Content Focus / Custom (six sliders).
- **Action tiers** License First ≥P90 • Next ≥P75 • Potential ≥P50 • Developing <P50.
- **Stable thresholds** Use ALL(EntraUsers) + ALL(M365Usage) — bands don't shift with slicers.
- **Workflow** Pick Balanced → filter License First → export your top 10% candidates.

How the Composite Score Works

Score Calculation

Each user receives a percentile rank within each M365 app relative to all other users. A score of 80 means more active than 80% of peers in that app. The composite score is the weighted average of these per-app percentiles.

Profile Presets

- **Balanced:** Equal weights across Teams, Outlook, Word, Excel, PowerPoint — good for general licensing decisions.
- **Collaboration Focus:** Heavy weight on Teams and Outlook — best when your Copilot rollout prioritizes meeting and email productivity.
- **Content Creation:** Heavy weight on Word, Excel, PowerPoint — best when document workflow productivity is the primary goal.
- **Custom:** You set the weight for each app manually. Weights do not need to sum to 100.

Action Category Thresholds

- **License First:** Score at or above 90th percentile — license immediately
- **License Next:** Score at 75th-89th percentile — strong candidate for next wave
- **Potential:** Score at 50th-74th percentile — provide enablement before licensing
- **Developing:** Score below 50th percentile — focus on foundational M365 engagement first

Key Tip

Changing the profile instantly re-ranks all users. Use this to model different licensing scenarios before committing to a wave. Try running Balanced, Collaboration Focus, and Content Creation profiles and compare which users appear in License First across all three — those are your safest first-wave candidates.

Key takeaways

- **Layout** Per-app sections (Teams • Outlook • Word • Excel • PPT).
- **Tiers** Top 10% • 10–25% • 25–50% • Bottom 50% by event volume.
- **Source** Per-app *Activity Summary LL* calc tables, joined 1:1 to EntraUsers.
- **Read it** If Word skews Heavy and Excel Light, sequence your campaign on Word first.

Key takeaways

- **Axes** X = M365 percentile • Y = Copilot percentile (both tenant-wide).
- **Top-Right Power Users** Promote and recruit — your existing champions.
- **Bottom-Right Untapped** Highest ROI — heavy M365 use, no Copilot yet.
- **Top-Left Eager** Coach on broader M365 fluency.
- **Bottom-Left Latent** Long-term — M365 fundamentals first.
- **v2.6.1 change** Copilot axis now ranks on PromptCount (human prompts).

Key takeaways

- **Left table** Inactive license holders — Enable (M365-active) or Reclaim (no signal).
- **Right table** Highest-engagement unlicensed users, ranked for assignment.
- **Filter rail** Inactivity Window • License-First Signals • Department • Country.
- **KPI value** Monthly Reclaim Value = Inactive Licenses × \$30.
- **Pro tip** Action is a measure — use the Filters pane for Reclaim/Enable filtering.

Key takeaways

- **Champion definition** Top 10% by OPT Copilot Actions (Lookback) among users with ≥ 1 action.
- **Left table** Top champions with rank, dept, Copilot + Agent counts, last Copilot date.
- **Right table** Per-dept champion count + champion-to-user ratio.
- **vs. Quadrant** Optimizer = 1D volume rank. Quadrant = 2D percentile intersection.
- **Use it for** Recruiting pilot leads, spotting concentration risk, gap-finding.

Metric Glossary

Definitions, calculations, and data sources for every metric in this report. Filter by page to focus on what is relevant.

Filter by page

- ☐ Select all
- ☐ Executive Summary
- ☐ M365 Usage Trends
- ☐ Department Readiness Benchmark
- ☐ Adoption Momentum
- ☐ M365 Usage Activity
- ☐ Copilot License Recommendations Counts
- ☐ Copilot Enablement Strategy Quadrant
- ☐ Copilot License Optimizer
- ☐ Copilot Champions
- ☐ Glossary & Definitions

About this report
Use the page filter above to focus the definitions that are relevant to your current analysis.

Data sources
M365 usage activity, Entra user attributes, and M365 Copilot session exports.

Interaction tip
Use Select all to reset the glossary. Multi-select page names to compare definitions across report sections.

Page	Metric	Definition & Calculation
Executive Summary	About this page	Executive view of M365 reach, app activity, Copilot usage, and organizational coverage. The stacked bar separates each app total into its underlying action types.
Executive Summary	M365 Users	Distinct users with a nonblank M365 activity tier in the current filter context.
Executive Summary	Teams Activity	Total Teams actions across users, including sent and read messages plus meeting activity.
Executive Summary	Email Activity	Total Outlook activity across users, based on sent and accessed mail events.
Executive Summary	Word Activity	Total Word file activity. The card is bound to the existing Total Word Activity measure.
Executive Summary	Copilot Users	Distinct users with Copilot workload or CopilotInteraction activity in scope.
Executive Summary	Departments Tracked	Distinct nonblank department values from the Entra user profile data.
Executive Summary	M365 activity by app and action	Stacked action mix: Teams shows messages sent, messages read, and meetings; Outlook shows emails sent and read; Word, Excel, and PowerPoint show views, edits, downloads, and uploads.
M365 Usage Trends	Total Users	Distinct Entra user principal names in the current filter context.
M365 Usage Trends	Active M365 Users	Users whose M365 All Apps Total is greater than zero.
M365 Usage Trends	M365 All Apps Total	Sum of supported Office file, Exchange, Teams, and Copilot interaction events.
M365 Usage Trends	Avg Actions Per User	M365 All Apps Total divided by distinct users, returning zero when there are no users.
M365 Usage Trends	Actions by app	Ranks the selected app activity measure so the largest contributors are easy to compare.
M365 Usage Trends	Weekly activity by app	Weekly totals for Teams, Outlook, Word, PowerPoint, and Excel activity.
M365 Usage Trends	Activity share by app	Each application's share of total M365 activity in the current context.
M365 Usage Trends	Activity tiers	Users are grouped by relative activity: Top 10%, 10-25%, 25-50%, and Bottom 50%.
Department Readiness Benchmark	About this page	Compares normalized adoption signals across departments so program leaders can decide where to assign licenses, enable existing license holders, build M365 foundations, or scale

Filters

Key takeaways

- **Purpose** In-template reference for every measure on the dashboard.
- **Use case** Quick stakeholder lookup during live walkthroughs.
- **Mirror** Same content as §8 of this guide (next section).

Methodology

M365 Usage Dashboard — Interpretation Guide • September 5, 2026

Composite score formula

```
composite =  
    (Teams_count      × Teams_weight)  
+ (Outlook_count    × Outlook_weight)  
+ (Word_count       × Word_weight)  
+ (Excel_count      × Excel_weight)  
+ (PPT_count        × PPT_weight)  
+ (CopilotChat      × CopilotChat_weight)
```

Weights are read from LP Weight Profiles (or, for Custom, from the six sliders). They should sum to 1.0 — if Custom weights don't, the composite scales accordingly.

Two percentile patterns

- **LP Composite Score Stable** DAX rank against the entire tenant, using ALL(EntraUsers) and ALL(M365Usage). Thresholds stay anchored to tenant-wide values — slicers don't move the bands.
- **CE Copilot Percentile** Pre-computed in Python and shipped as CECopilotPercentile_L30 / _L60 / _Full. As of v2.6.1, basis is PromptCount from SessionStats.csv, not raw audit events.

Methodology • Prompts vs. events

The pipeline tracks two related but very different volumes.

EventCount

Audit log (one per rollup row)

Sensitive to inflation — agent fanout, retries, plugin chains can multiply 100×+.

PromptCount

SessionStats.csv (one per isPrompt=TRUE)

Mirrors what a human typed — resistant to service-principal and chain noise.

Canonical Copilot Prompts measure (Optimizer + Champions pages)

Copilot Prompts = SUM('M365CopilotSessions'[PromptCount])

No AppHost filter is applied — SecurityCopilot prompts are intentionally included to match the published template behavior.

Methodology • Inactivity vs. lookback windows

Two independent time controls on the Optimizer page — don't conflate them.

Inactivity Window

Defines who counts as INACTIVE in the left table (v_tbl_reclaim).

30 / 60 / 90 days • defaults to 90

Lookback Window

Defines the activity tally for ranking in the right table (v_tbl_assign).

30 / 60 / 90 days • separately controlled

Why two controls?

So you can ask: 'Reclaim seats from anyone inactive 90 days, and assign them to whoever was most active in the last 30.' Keeping them separate gives reviewers more nuanced license-recovery scenarios.

Data pipeline • Python v2.6.1 outputs

Default rollup mode produces four CSVs from a Purview audit-log export.

File	Content	Used by
*_Rollup_<ts>.csv	14-col aggregated event facts	M365Usage
*_UserStats_<ts>.csv	66-col per-user metrics + CE percentile ranks	EntraUsers enrichment
*_SessionCohort_<ts>.csv	3-col per-(user, app) session bucket	Cohort visuals
*_SessionStats_<ts>.csv	8-col per-(user, date, AppHost) incl. PromptCount + AgentPromptCount	M365CopilotSessions

Refresh command (one-line, all 4 Purview pulls):

```
python Purview_..._v2.6.1.py --input Teams.csv Outlook.csv Files.csv Copilot.csv --output-dir ./out
```
